

In picture #1, to ease the pulling of a log (or other load), it is suggested to use a single pulley PCA-1274.

Install it as high as possible in a tree near the winch, it helps lifting the front of the load to prevent friction and can also be used to deviate the load when needed.

In picture #2 - Double the pulling power

1. Attach the Portable winch to an anchor tree with the polyester sling PCA-1259.
2. Attach first pulley to a tree nearby with sling and carabiner PCA-1276. Position it as high on the tree as possible, to reduce friction.
3. Install a second pulley PCA-1274 at the load.
4. The rope PCA-1213M goes from winch thru first pulley, then thru second pulley and is attached back to same tree as first pulley. The winch's 1 ton of pulling power is now doubled to 2 tons.
